---

<sup>1</sup>The Regional Information Report Series was established in 1987 to provide an information access system for all unpublished Divisional reports. These reports frequently serve diverse ad hoc informational purposes or archive basic uninterpreted data. To accommodate needs for up-to-date information, reports in this series may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without approval of the author or the Division of Commercial Fisheries Management and Development.

## **AUTHORS**

James D. Miller is a Region II Bristol Bay Research Biologist for the Alaska Department of Fish and Game, Division of Commercial Fisheries Management and Development, 333 Raspberry Road, Anchorage, AK 99518.

Linda K. Brannian is the Region II Regional Biometrician for the Alaska Department of Fish and Game, Division of Commercial Fisheries Management and Development, 333 Raspberry Road, Anchorage, AK 99518.

Beverly A. Cross is the Region II Bristol Bay Project Leader for the Alaska Department of Fish and Game, Division of Commercial Fisheries Management and Development, 333 Raspberry Road, Anchorage, AK 99518.

## INTRODUCTION

Nushagak River is located in southwestern Alaska, and flows approximately 390 km from its headwaters into Nushagak Bay, of Bristol Bay, Alaska. Nushagak River supports large populations of five species of Pacific salmon *Oncorhynchus* which are harvested in commercial, sport, and subsistence fisheries. Accurate escapement estimates into this system are essential to fisheries management. Hydroacoustic (sonar) equipment and procedures are used by the Alaska Department of Fish and Game (ADF&G) to count adult salmon entering Nushagak River.

Estimating numbers of Pacific salmon migrating up Nushagak River with sonar involves: (1) estimating the number of hydroacoustic targets passing through sonar beam(s) perpendicular to each river bank at our sonar project site; (2) estimating the species composition of those targets; and (3) combining estimates of hydroacoustic targets and species composition to estimate numbers of passing salmon by species. Brannian et al. (*in press*) evaluated the test fishing and species apportionment methods used during the 1991 season and compared them with methods used at a sonar project located on the lower Yukon River. Based on their review, new methods of estimating fish passage by species were incorporated for 1992.

Miller et al. (*in press*) reviewed the 1992 Nushagak River sonar project, described methods and results, and evaluated the new species apportionment techniques. The attached appendices contain historic data as well as raw data that can be used to duplicate methods used in Miller et al. (*In press*). The quantity of raw data required to replicate the 1992 methods is too extensive to include in the Technical Fisheries Report series, therefore these data have been documented here.
